

1. Create a file called playlist.txt and write the names of your top 3 favorite songs from Spotify into it using write mode (w).

```
file = open("playlist.txt", "w")

file.write("Tum Hi Ho\n")
file.write("Perfect\n")
file.write("Love Me Like You Do\n")

file.close()

print("Songs written successfully.")
```

2. Open playlist.txt in read mode (r) and display each song name on a separate line in the console.

```
file = open("playlist.txt", "r")

for song in file:
    print(song.strip())

file.close()
```

Easy logic:

"r" means **read mode**. The for loop reads each song one by one.

3. Add two more song names to playlist.txt without deleting the existing ones by opening the file in append mode (a).

```
file = open("playlist.txt", "a")
```

```
file.write("Shape of You\n")
```

```
file.write("Love Story\n")
```

```
file.close()
```

```
print("Songs added successfully.")
```

Easy logic:

"a" means **append mode**. It adds new data at the end without deleting existing songs.

**4. Write a program that reads all song names from playlist.txt and prints only those that contain the word 'love' (case-insensitive).

Hint: Use the 'in' keyword or equivalent string method for filtering.**

```
file = open("playlist.txt", "r")
```

```
for song in file:
```

```
    if "love" in song.lower():
```

```
        print(song.strip())
```

```
file.close()
```

Easy logic:

- song.lower() converts the song name to lowercase.
- "love" in song.lower() checks whether the word **love** is present.
- This makes the search **case-insensitive**, so Love, LOVE, and love all match.

Example output:

Love Me Like You Do

Love Story
