

1. Given the following buggy code meant to calculate the total price of a Zomato order, identify and fix the syntax and runtime errors:

`let items = ["Burger", "Pizza", "Fries"];
let prices = [120, 250, 90];
let total = 0;
for (i = 0; i < items.length; i++) {
 total += prices[i]
}
console.log("Total price is: " + total);`
Hint: Watch for assignment and loop variable issues.

Errors:

- `i` should be declared using `let`.
- `total += prices[i]` is wrong. It should be `total += prices[i]`.
- Missing semicolon after `prices[i]` (optional in JavaScript, but good practice).

```
let items = ["Burger", "Pizza", "Fries"];
```

```
let prices = [120, 250, 90];
```

```
let total = 0;
```

```
// Add each item's price to the total
```

```
for (let i = 0; i < items.length; i++) {
```

```
  total += prices[i];
```

```
}
```

```
console.log("Total price is: " + total);
```

Output:

Total price is: 460

2. Rewrite the following code to improve its indentation and add comments explaining each step, so that a beginner can understand what it does:

`function isEven(num){if(num%2==0){return true;}else{return false;}}`

```
// This function checks whether a number is even
```

```
function isEven(num) {  
  
    // If the remainder is 0, the number is even  
    if (num % 2 == 0) {  
        return true;  
    }  
    else {  
        return false;  
    }  
}
```

// Example

```
console.log(isEven(10));
```

Output:

true

Easy logic:

If a number is divided by 2 and the remainder is 0, it is an **even number**.

3. Write a function `formatFollowersCount(count)` that takes a number and returns a formatted string like Instagram: 1500 as '1.5K', 1200000 as '1.2M', and numbers below 1000 as-is. Add clear comments and use proper indentation.

// This function formats follower counts like Instagram

```
function formatFollowersCount(count) {  
  
    // Convert millions into M  
    if (count >= 1000000) {  
        return (count / 1000000).toFixed(1) + "M";  
    }  
}
```

```
// Convert thousands into K
else if (count >= 1000) {
    return (count / 1000).toFixed(1) + "K";
}

// Numbers below 1000 are returned as they are
else {
    return count.toString();
}
}
```

```
// Examples
console.log(formatFollowersCount(1500));
console.log(formatFollowersCount(1200000));
console.log(formatFollowersCount(500));
```

Output:

```
1.5K
1.2M
500
```

**4. You are given a piece of JavaScript code that should print all even numbers from 1 to 10, but it doesn't work as expected:

for (let i = 1; i <= 10; i++) {
 if (i % 2 = 0) {
 console.log(i)
 }
}

Find and fix the error, then rewrite the code with good indentation and at least one comment explaining the logic.**

Error:

i % 2 = 0 is incorrect because = is an **assignment operator**.
We need to check equality using == or ===.

```
// Print even numbers from 1 to 10

for (let i = 1; i <= 10; i++) {

    // If the remainder after dividing by 2 is 0, it is even
    if (i % 2 === 0) {
        console.log(i);
    }
}
```

Output:

```
2
4
6
8
10
```
