

1. install GCC on your computer and verify the installation by running gcc --version in your terminal or command prompt.

After installing GCC, open **Command Prompt / Terminal** and type:

```
gcc --version
```

If GCC is installed correctly, it will show the **GCC version information**.

2. Open VS Code or DevC++ and create a new file named hello.c. Write a C program that prints 'Hello, Instagram World!' to the console.

Open **VS Code or Dev-C++**, create a new file named **hello.c**, and write:

```
#include <stdio.h>

int main()
{
    printf("Hello, Instagram World!");
    return 0;
}
```

Output:

Hello, Instagram World!

3. Identify and label the header, main function, and return statement in your hello.c program using comments.

Use comments like this:

```
#include <stdio.h>

int main()
{
    printf("Hello, Instagram World!");
    return 0;
}
```

- `#include <stdio.h>` → **Header**
 - `int main()` → **Main Function**
 - `return 0;` → **Return Statement**
-

4. Compile your hello.c file using the GCC command line (`gcc hello.c -o hello`) and run the output file to display the message in your terminal.
Hint: On Windows, the output file will be hello.exe; on Linux/Mac, it will be hello.

Open the terminal in the folder containing hello.c.

Compile:

```
gcc hello.c -o hello
```

Then run it.

Windows:

```
hello
```

```
or
```

```
hello.exe
```

Linux / Mac:

```
./hello
```

Output:

```
Hello, Instagram World!
```

Final program:

```
// Header
```

```
#include <stdio.h>
```

```
// Main Function
```

```
int main()
```

```
{
```

```
printf("Hello, Instagram World!");
```

```
// Return Statement
```

```
return 0;
```

```
}
```
